KEY MESSAGES

- A new study by Statistics Canada ^{Footnote 1} found evidence that Indigenous early childhood development programs such as Aboriginal Head Start in Urban and Northern Communities (AHSUNC) are associated with **positive health and education outcomes for both elementary and intermediate/high school** aged Canadian Indigenous children.
- The study also found that AHSUNC is **successfully reaching high risk Indigenous populations**. Children who have attended these programs experience significantly greater socio-demographic challenges such as living with a single parent, having a parent or grandparent who attended residential school, living in the north and in a lower income household than those who attended non-Indigenous-focused early child development programs.
- Children and youth who participated in AHSUNC **achieve similar health and education outcomes as their peers who are not faced with the same adversity**.
- These results suggest that AHSUNC and its focus on Indigenous culture and language helps participating Indigenous children to close the gap in health and education outcomes with non-AHSUNC participants who are not faced with the same adversity. These results also suggest that the program helps these children become more resilient and results in healthier and higher-achieving students.
