## Abstract

Labor force participation among U.S. men and women ages 25 to 54 has been declining for nearly 20 years, a stark contrast with rising participation in Canada over this period. Three-fourths of the difference between the two countries can be explained by the growing gap in labor force attachment of women. A key factor is the extensive parental leave policies in Canada. If the United States could reverse the trend in participation of prime-age women to match Canada, it would see 5 million additional prime-age workers join the labor force.
